How to generate PHP from UML

Instant Generator is the process of producing source code from <u>UML class model</u>. Designers or software architects can build a high level domain class model, then pass to programmer to perform more lower-level system or application modeling and eventually generate source code from implementation model. This chain makes building software faster and cheaper. In this chapter, we will go through the instant generation of PHP. To generate code by instant generator:

- 1. Select **Tools > Code > Instant Generator** from the toolbar.
- 2. In the Instant Generator window, select PHP as the Language.
- 3. Fill in the **Output Path**, which is the directory where you want the code to generate to.
- 4. Select the classes to generate code. In the **Diagrams** tab, you can select the diagrams to generate code for classes in the selected diagrams. Alternatively, open the **Model**

- 5. Optionally configure the generator options. Read the section below for a description of options.
- 6. Click **Generate** to generate code.

Overview of Instant Generator

\$	Instant Generator	×
Language: PHP V Select elements for code generation Diagrams Model Elements	1	Options Attribute prefix:
 Article Writing UML Diagrams Class Diagram (3) Opmain diagram pkg: presentation pkg: writing 	Preview Stretch v	Parameter prefix: a Implement abstract operations Generate association operations Directory: Follow package v Solutions Advanced Options
Output path: Template directory: C:\Program Files\Visua Prompt to confirm overwrite file Generator Output	Paradigm 11. 1/resources/instantgenerator/php	
Open Output Folder	8	Preview Generate Close

No.	Name	Description	
1		Language	The programming language to generate.
2		Model element tree	A list of packages and classes that can be selected for code generation. You must select classes for code generation.
3		General options	Some of the common configurable options are shown here. You can configure them in advanced options.
4		Output path	The folder where you want the code files to be generated.
5		Template directory	Template governs how code will be generated from model to code. You can customize the template to suit your needs, such as to print

No.	Name	Description	
			company specific headers to each code file. If you want to use your own template, provide the template directory here. If you want to keep using the build in template, leave this option unchanged to let Visual Paradigm generate with build in template. To learn more about customization, read the final chapter of this part.
6		Advanced options	Click this button to configure any options related to code generation in a new window.
7		Prompt to confirm overwrite file	If a code file instant generator going to generate is already exist, by checking this option you will be asked whether to overwrite that file or not. If you uncheck this option, it will help you to overwrite the existing file automatically.
8		Output pane	Any warning, error or progress about generation will be printed here.
9		Open output folder	Open the output path with system browser.
10		Preview	Click to preview the code content. It is just a preview and code will not be generated to the output path by previewing.
11 12		Generate Close	Click to start generation. Click to close the instant generator.

Generator options

On the **Instant Generator** window you can configure some of the common code options at the right of window. You can also configure the advanced options for more detailed settings by clicking the **Advanced Options...** button.

😣 Advanc	ed Options for PHP Code Generation	×
Encoding Default (windows-12) Other: Big5	52]	~
Language		
Attribute prefix:	_	
Parameter prefix:	a	
Include referenced p	rojects	
Indentation:	<tab></tab>	Tab
Generate unnamed a	ttribute	
Unnamed attribute:	Unnamed_\${classname}_	Classname
Invalid char replacement:	_	
Generate < <import></import>	> dependencies	
✓ Implement abstract operations		
Generate association operations		
Generate simple collection operations		
Generate additional collection operations		
Local variable prefix:	I	
Directory:	Follow package	~
Set as Default	lestore to Default OK	Cancel

Below is a description of available options.

Option	Description	
Encoding		The encoding of source file.
Attribute prefix		The text to append to attribute name as prefix.
Parameter pre	fix	The text to append to parameter name as prefix.
Allow From Lir	nked Project	Check to generate also classes in referenced project.
Indentation		Character(s) used for indentation, default is Tab.
Generate unna	amed attribute	Whether to generate nameless attributes.
Unnamed attril	bute	The naming pattern of nameless attributes.
Invalid char rej	placement	Invalid char refers to characters that will result in a compile error when compiling code. This option is for replacing thsoe invalid characters by given character.
Implement abs	stract operations	Whether or not to generate operations for implementing abstract operations in subclass.
Generate asso	ciation operations	If you check this box, when a role is selected to provide setter/getter, the corresponding operation(s) will be generated for the role's attribute.
Generate simp	le collection operations	Whether or not to generate setter and getter for accessing attribute of associated class, when getter and setter are checked.

Option Description	
Generate additional collection operations	Whether or not to generate add, remove and to methods for accessing attribute of associated class, when getter and setter are checked.
Local variable prefix	The characters to be appended to local variables.
Directory
