## How to generate UML from ORM POJO classes

You can generate [ORM](#) classes which has POJO be the persistent API. On the contrary, those generated POJO classes can be reversed back to [class model](#). This is particularly useful when you want to produce a class diagram from legacy ORM classes (code).

To reverse engineer class model from ORM POJO classes:

1. Select **Tools > Hibernate > Reverse Java Classes...** from the toolbar.
2. In the **Reverse Java Classes** dialog box, click **Add** to add the classpaths where the ORM classes exist.
3. From the **Available Classes** pane, select the classes you want to reverse and click **>**.
4. Click **OK**. You can find the reversed classes in the **Model Explorer**.
